Earl,

I am done looking at that stuff. I have a 10 and 11 am meeting, would later this afternoon work for you to discuss?

I agree with you that their proposed solution, IC's and maintaining the current collection system is insufficient, is not protective, does not satisfy ARARs. Also, why would they only be looking at soil washing vs some other treatment for the LNAPL? They could do a more aggressive extraction system (pump and treat, or more active oil recovery through the trench and then Thermal or bio treatment may have promise (once we knock down the free product).

They should also determine the extent of sediment contamination in the river.

Not much information on how much product they anticipate remaining on site, and which needs to be treated.

The previous investigation/removal write up is spartan as well.
